

ABSTRACT

The Strategic Communications Office (SCO) at De La Salle University – Dasmariñas faces operational bottlenecks due to manual processes involving unstructured emails and decentralized spreadsheets, often resulting in overlooked requests and tracking difficulties. To address these issues, this study developed S-CORE (SCO - Creative Optimization for Requests and Engagement), a centralized web-based system designed to automate service requests, approval workflows, and task monitoring. Utilizing Agile methodology, the system was evaluated against ISO/IEC 25010:2023 standards through a mixed-method approach involving 100 respondents including SCO personnel, IT professionals, student organizations, and institutional offices. Quantitative results revealed that S-CORE achieved an overall weighted mean of 4.68 which is interpreted as "Strongly Agree" with high ratings in Portability and Maintainability. Qualitative feedback supported these findings, confirming that the system functions as a reliable digital archive that eliminates the confusion of messy email chains and ensures no request is lost or forgotten. The study concludes that S-CORE significantly enhances operational efficiency, recommending the integration of advanced analytics, bulk action capabilities, and full institutional implementation to modernize the university's communication workflows effectively.
