Cabrera, Caryl Joy D.

Hilario, Jian Marie L.

October 2025

CHAPTER 1

INTRODUCTION

Background of the Study

A web-based system is an application software that operates and is accessible through a web browser. These systems are convenient and flexible as they are designed to be accessed from any internet-enabled devices (Keary 2024). According to Cheruku (2024), these web-based systems are truly essential in modern organizations since they offer several advantages over the traditional systems such as enhanced accessibility, efficiency, and automation. Additionally, these systems enhance administrative work through the automating of some functions like entry of data, scheduling, and communication by providing real-time updates and assisting collaboration among team members (Bantaculo 2024). A specific type of web-based system made for simplification of service requests' handling, approval, as well as work management is that of a web-based request approval and management system (Zendesk 2024).

A request approval and management system is a software tool that is intended for automating the management of service requests, approval, and task management within a company or an organization. The main purpose of this software tool is to enhance operational productivity by acting as a centralized platform whereby users can submit, monitor, and manage requests in real-time (Zendesk 2024). Such a system is crucial in the modern work environment since it supports in keeping pace with productivity, timely fulfillment of tasks, and minimizes chances of errors and miscommunications (ServiceNow n.d.). The fundamental features of a request approval and management system include automated workflows, real-time notifications, delegations of

Commented [JH2]: 1. Introduction to the Web-Based System

- Definition of a **web-based system** and its relevance to modern organizations.
- Advantages of **web-based solutions** over traditional systems (e.g., accessibility, efficiency, automation).
- Role of **web applications** in improving administrative processes and communication.

2. Overview of Web-Based Project Management Systems

- Definition and purpose of **project management systems** in an organizational setting.
- How project management systems streamline **task management, workflow tracking, and communication**.
- Examples of existing **project management tools** (e.g., Trello, Asana, Jira) and their relevance to the study.

3. Current Scenario of the Strategic Communications Office (SCO)

- Overview of the **DLSU-D Strategic Communications Office (SCO)**:
 - Its role in managing university media, public relations, and branding.
 - Current workflow for handling requests (email and Microsoft Teams).
 - Issues faced with the current system:
 - Overloaded emails and lost messages.
 - Lack of a centralized request tracking system.
 - Time-consuming manual approval process.
 - Difficulty in monitoring tasks and deadlines.

4. Definitions of Key Concepts

- Web-based request management system** – A digital platform for organizing, processing, and tracking service requests.
- Task management system** – A feature within project management systems that assigns and monitors tasks.
- Approval workflow** – The structured process of reviewing and approving requests.
- User roles and access control** – Different levels of access for requesters, administrators, and staff.

5. Detailed Explanation of the Study's Context

- General-to-Specific Approach:**
 - General context: The need for efficient communication and project management in organizations.

Commented [MR3]: request approval and management have been used in a statement but is used separately in a different paragraph, and is sometimes used interchangeably

tasks, and resource allocation tools. These functionalities help organizations process requests effectively, enhance team collaboration, and enhance the quality-of-service delivery (Atlassian n.d.). Through the inclusion of such functionalities, a request management and approval system facilitate the smooth processing of tasks, ensures maximum user satisfaction, and supports the general success of the organization (Malsam 2023).

Offices and institutions are adopting more request approval and management systems to increase process automation and efficiency. These systems enable the requests, approvals, and document workflows to be processed faster, which enhances organizational communication and reduces delays stemming from traditional methods such as email. With these systems, organizations can respond to approvals in a timely manner as well as track them more accurately, along with the accompanying documents. Approval workflows automatically manage the routing of business processes to lessen dependency on emails that could slow down communications (Yossy & Darmawan 2023). As an example, the HDAS or Hierarchical Document Approval System automates the routing of documents for approval which leads to much faster turnaround time (Divya et al. 2023). Even with these advantages, some organizations might prefer the traditional methods due to concerns associated with adopting new technology, retraining staff, and disruptions during the shift to increasingly automated systems. This poses a challenge even if it is beneficial for companies and departments.

The De La Salle University – Dasmariñas (DLSU-D) is a Lasallian co-educational secondary and higher institution, which is governed privately and is operated under the administration of the De La Salle Brothers of the Philippine District of the Christian Brothers in Dasmariñas, the Philippines (International Achievements Research Center 2022). A Lasallian education has given rise to leaders of the province, while the graduates are now present everywhere

in the industries and businesses. This reflects the qualities of competence, hardworking, steadfastness, etc., which were brought through a curriculum supportive of education countrywide. Having a mindset of the practical needs of the students before they join the workforce was the motivation for its development (DLSU – Dasmariñas n.d.). To be one of the most renowned universities in Cavite is an institutional effort, and a significant part of it is from its strategic communications managed by the Strategic Communications Office (SCO), responsible for the university's media.

Strategic communication is the purposeful use of communication that business or organizations use to achieve their goals for marketing and public relations. It is a type of focused communication that is designed for maximum impact and achievement of the intended objectives. As a component of a broader strategy, strategic communication is a systematic approach that focuses on the end goals, rather than on individual actions (UTS Online 2024). Furthermore, professionals and practitioners of the strategic communications field have an obligation to enhance the scope of equity, inclusiveness, and diversity by influencing social narratives and engaging with a broad spectrum of audiences (Bush & Lindsey 2024). In the business environment, strategic communication is beneficial to business organizations and supports their corporate social responsibility (CSR) efforts, allowing an organization to achieve a positive return while enhancing their reputation brand equity in the same breath (Al-Abdallat 2024).

The Strategic Communications Office (SCO) at the De La Salle University-Dasmariñas (DLSU-D) identifies the information needs of the different offices of the academic community and develops appropriate communication strategies to meet those needs, ensuring that institutional announcements, publicity materials, and engagement efforts released under the name of the university are effectively disseminated and will not cause inconveniences (DLSU – Dasmariñas

Commented [RS4]: rephrase

Commented [CC5R4]: rephrased

n.d.). The SCO was formerly known as the Institutional Communications Office (ICO) before being renamed the Marketing Communications Office (MCO), and it is now called the Strategic Communications Office (SCO). Institutional information materials are developed, and the staff creates contacts with the media and implements marketing strategies that accurately represent the university. The office aims at the realization of effective communication management to gain some specific goals such as building a strong brand for the university, promoting academic programs, and keeping good relationships with the university's stakeholders. The office's positive outcomes are based on the knowledge of the target audiences, setting of clear objectives, formulation of the key messages, proper selection of the communication channels, and regular monitoring and evaluation of the results. The SCO maintain a structured reporting system to ensure the timely tracking of accomplishments, projects, events, and requests. Their daily tasks are recorded in an Excel tracker, while monthly reports are maintained for internal tracking. Quarterly reports, which summarize data from the past three months, are submitted to the Chief Administrative Officer (CAO) for institutional assessment. Furthermore, the SCO has four main divisions to ensure it can manage its diverse functions efficiently: the Social Media Unit, which oversees official pages, updates, and monitors engagement; the Graphics Unit, which creates publicity materials, merchandise, and event graphics with consistent branding of DLSU-D; the Multimedia Unit, which performs photo and video editing, media coverage, and event documentation; and the Public Relations Unit, which oversees publications, proofreads official letters, and maintains internal and external communications. Each unit reports to its immediate head or director and submits individual reports on achievements, projects, and requests. These reports are combined and presented to higher-ups by the director to maintain transparency and accountability. Each of these

units is essential to the upkeep of the university brand, delivering accuracy and success with its message and establishing sincere relations with stakeholders.

Among the many responsibilities the SCO may undertake are media relations management, content creation, public relations initiatives, crisis communication, and internal communication, all intended to project a favorable image, communicate the university's mission and values, and establish a strong internal and external communication network. One of the main purposes of the Strategic Communications Office is providing publishing and advertising to the media for the DLSU-D. Their key function is creating publicity materials for promotions, recognitions, announcements, and information dissemination of the university projects, programs, initiatives, services, developments, innovations, collaborations, engagements, and so forth. From the ideation, concept design, photoshoots, video shoots, layout, editing, revising, and finalizing, to manufacturing of marketing materials, the SCO guarantees quality content production. Student organizations and other entities request approval from the SCO for reviewing their logos, event publication materials, promotional merchandise, and other related collateral materials to ensure that their content is accurate and of high quality. In general, their role is vital because it concerns the management of DLSU-D brand image and reputation. Through the SCO, the university can improve its visibility and effectively reach a wider audience.

Furthermore, the SCO follows a structured request handling and approval process to maintain consistency and uphold university standards. On average, the SCO handles 20-30 requests per month, with daily requests ranging from 1-3 requests, sometimes increasing to 3-6 per day. Simple edits receive feedback within 1-3 days, but certain tasks may be put on hold due to urgent priorities. SCO also facilitates event coverage upon request but does not charge fees or request benefits for their services. Meetings are also conducted to plan coverage strategies, and

request progress is visible to all team members involved in event execution. Requests for social media posts, graphics, multimedia materials, and public relations items should be made using a standardized form and are screened by the concerned units. The approval process goes through several layers of review, including consistency with DLSU-D's brand guidelines, accuracy of messaging, and strategic priorities. Additionally, the SCO enforces specific timelines and revision policies, allowing a maximum of three major and two minor revisions per request. By implementing these measures, the office ensures that all communication materials effectively represent the university while maintaining high standards of quality and professionalism. Moreover, to enhance efficiency, the SCO is working on improving its request tracking and approval process, as current workflows are manually tracked using Excel. Future improvements, including digital automation for request handling, role assignments, and approval notifications, are being explored to streamline operations and better support the university's communication needs.

The Strategic Communications Office, despite being a pivotal office in the institution, does not have its very own platform to cater to the stakeholders for their services and resources. Requests and approvals can only be sent through emailing letters to the SCO Outlook Mail or posting messages to the SCO Microsoft Teams channel. Without a centralized request tracking system, every day, multiple emails and MS Teams notifications come in for different purposes, causing important matters to get mixed up and overlooked, which undermines the productivity of SCO. The SCO may sometimes need to backtrack, retrace its steps, or look for specific requests by name, which can take additional time. Moreover, the current manual tracking system the SCO poses more issues faced currently by the SCO are the time-consuming manual approval process and difficulty in monitoring tasks and deadlines. At present, requests are manually tracked per unit without a centralized platform for seamless coordination.

- Commented [RS6]: prev MCO - year > SCO > Director, Coordinator, etc
- Commented [CC7R6]: Notes: year established, short background, director staff (headed by)
- Commented [CC8R6]: Update: Info about BFMO and ICTC omitted

In today's fast digital environment, effective project management and efficient communication are essential to achieve organizational goals. Given the critical responsibilities of the SCO, the office necessitates a centralized platform for processing service requests, publication approvals, and media-related inquiries, instead of relying on traditional methods. A centralized, organized, and well-structured solution is a must considering the discussed factors. The researchers propose a study that develops SCO – Creative Optimization for Requests and Engagement (S-CORE) system, a web-based request approval and management system designed to provide a streamlined management system for undertaking the setbacks shouldered by the Strategic Communications Office. The system will eliminate the inefficiencies of email exchanges by providing a structured process where offices, student organizations, and other stakeholders can submit and track their requests in real time. S-CORE removes the need, and the steps required for email exchanges in the request process, thereby minimizing the entire workflow to a process for the requester to submit and track the request and a SCO process to both receive, process, approve and respond to the inquiries in an organized way. Operational efficiency will improve significantly, processing time will be reduced, and both human oversight, human contribution, and errors will be minimized by the proposed system.

In addition to optimizing efficiency further, the S-CORE web-based system will have added task management to delegate and monitor tasks per project to have clear deadlines and responsibilities. The request approval and management system will also allow for a single dashboard through which users can keep track of their publication, media, and service requests in real time. Automated reminders will push real-time reminders and notifications for approval of requests, outstanding work, and deadlines. With appropriate resource allocation features, it will ensure proper distribution of workload by allocating the tasks to the right personnel to match their

position, availability, and skillset. Collaboration capabilities such as a built-in integrated commenting system will facilitate communication between requesters and SCO without having to resort to using third-party applications. Moreover, the S-CORE web-based system will integrate automation solutions such as automatic report generation (daily, monthly, quarterly reports), real-time tracking dashboards, and improved access control. The system will allow the SCO secretary and director to generate reports, while unit members will have view-only access to ensure security and data integrity. This will enhance task delegation and monitoring, ensure clear deadlines and responsibilities while providing valuable insights into request patterns and task performance.

All tasks will be accompanied with performance insights to provide analysis and reports for completed tasks, request patterns, and turnaround to support decision making. Approval workflow will include personalized workflows to permit requests to receive required reviews before final approval. User management of roles will establish varying levels of access for requesters, SCO staff, and administrators to ensure data security and integrity. The system's capability to provide real-time reports and analyze the projects will enable the SCO to make informed decisions, allocate resources efficiently, and measure the effects of its initiatives. With this, the researchers are motivated to conduct a study that seeks to address the SCO's needs and adds to a larger area of request management through the exhibition of a web-based solution that can solve the issues of 21st century organizations. Through the application of innovative technology solutions, this project will be able to equip the Strategic Communications Office with efficiency, transparency, and streamlined workflow management, which in turn will advance its contribution to DLSU-D's institutional goals.

Statement of the Problem

Given the challenges, this research aims to create S-CORE, an online request approval and management system that increases SCO's operational effectiveness, facilitates better communication, and guarantees streamlined workflow implementation.

This research addresses the following research questions:

1. How can the request handling and approval processes of the SCO be streamlined?
2. How can the existing resources and tools of the SCO be better utilized to improve operational efficiency?
3. How can communication between the SCO and its stakeholders be improved to ensure timely and accurate request processing?
4. How can the task monitoring and reporting processes of the SCO be enhanced to support transparency and accountability?
5. How can the SCO ensure that its request approval and management processes meet the ISO/IEC 25010:2023 standards for Functional Suitability, Performance Efficiency, Compatibility, Usability, Reliability, Security, Maintainability and Portability?

Objectives of the Study

The general objective of the study is to create S-CORE, a streamlined system for the Strategic Communications Office (SCO) in De La Salle University – Dasmariñas (DLSU-D) to improve their structure, productivity, and stakeholder relations. The system will enhance the overall process of SCO's services by reducing the ineffectiveness of its existing request management and task tracking processes.

Specifically, the project aims to do the following:

Commented [MR9]: refine this. focus on the study's problem and not on the software to be developed.

ex.

1. How to streamline all the processes of the SCO?
2. How to utilize the current resources of the SCO?

Commented [MR10R9]: do not create compound statements.

Commented [MR11R9]: in your objective 1, you also mentioned about "secure web-based approval" would this mean there is a problem in terms of security?

1. To streamline the request handling and approval processes of the SCO.
2. To optimize the utilization of existing resources and tools to improve the operational efficiency of the SCO.
3. To enhance communication between the SCO and its stakeholders for timely and accurate request processing.
4. To improve task monitoring and reporting mechanisms to support transparency and accountability.
5. To evaluate the SCO's request management practices based on the ISO/IEC 25010:2023 standards for Functional Suitability, Performance Efficiency, Compatibility, Usability, Reliability, Security, Maintainability and Portability.

Commented [MR12]: should address each new SOPs

Significance of the Study

Commented [RS13]: DLSU-D - SCO - Director & Staff - To the Proponents - To the Future Researchers

The significance of this study lies in its capacity to improve productivity and work of the Strategic Communications Office (SCO) of De La Salle University – Dasmariñas (DLSU-D) by reducing SCO staff's workload and giving stakeholders a better and more efficient way of communicating.

To be specific, this study will benefit the following:

De La Salle University – Dasmariñas (DLSU-D) – The application of the system is consistent with DLSU-D's goal of innovation, digitalization, and operational excellence. Being an educational institution, DLSU-D's goal is to continually improve its administrative process to foster its cause of delivering quality education and a structured academic environment. The Strategic Communications Office (SCO) has a significant purpose in institutional communication

management, managing publicity materials, and keeping the university's image strong and consistent. The implementation of the system will improve the effectiveness of the approval of services requests, with a more organized and transparent process in the university. Through automated workflows, the system will remove administrative hassles and improve SCO coordination with other institutional offices. The university's sustainability initiatives will also be supported by the system as it will minimize paper-based transactions and optimize resource allocation. Ultimately, the system will improve the university's ability to sustain a professional, responsive, and well-organized communication system.

Strategic Communications Office (SCO) – The system will streamline the management of service requests, approvals, and communication, overall enhancing the quality of service provided by the SCO. With the system's centralized data storage, the SCO can reduce the time spent on searching through emails and notifications. Additionally, the system will provide automated report generation features, allowing the SCO to generate timely and accurate reports on communication trends and service request statuses. With the efficient and professional handling of communications and service requests, the SCO will keep the university's image and reputation clean and more organized and responsive.

Director of the Strategic Communications Office (SCO) – The system will provide a comprehensive overview of all services request, approvals, and communication activities. This helps the director to make informed decisions, monitor progress, and ensure the office is operating efficiently.

Staff of the Strategic Communications Office (SCO) – Staff will experience significant benefits from the new system. It will streamline the management of service requests and approvals;

therefore, it will reduce the SCO staff's workload, and this will allow them to focus on more strategic and high-quality projects.

Institutional Offices – The DLSU-D offices that work with the SCO, including the Office of Student Services (OSS), the Office of the Vice Chancellor for Academics and Research (OVCAR), the Information and Communications Technology Center (ICTC), and the Building and Facilities Management Office (BFMO), will also stand to gain from the system's enhanced coordination and transparency. The site will improve the flow of communication between these offices and the SCO so that formal announcements, publicity documents, and institutional campaigns can be overseen and passed on more effectively. By automating the submission of requests and follow-ups, institutional offices will be able to meet their communications requirements, avoid delays, and integrate workflows better and more efficiently.

Student Organizations – The system will have a user-friendly platform that they can utilize to submit and track their service requests hence making it simpler for them to interact with SCO. This should also enable more efficient and transparent two-way communication regarding requests and inquiries between students, organizations, and the SCO. By managing and organizing service request workflows, the system will reduce the administrative burden on students and organizations, allowing them to focus more on their core activities and initiatives.

Students – The study will provide insights into the development and implementation of a web-based request approval and management system, offering them practical knowledge that can also be applied to their own projects. Students willing to research in related fields, such as information systems, communication management, and organizational efficiency, will find the detailed documentation and analysis of the S-CORE system particularly useful for reference.

Proponents – The researchers will benefit from this study, the creation and implementation of SCORE system will be a valuable experience and recognition for the proponents. The successful development of the system will address their ability to innovate solutions and showcase their technical problem-solving skills.

Future Researchers – Future researchers will benefit from this study because it can serve as a steppingstone or a blueprint laying the groundwork for future research addressing the effect of digital management systems on organizational efficiency and communication strategies. The implementation of the S-CORE system at DLSU-D can also serve as a case study for examining the challenges and successes of digital transformation in educational institutions. This study's findings on the benefits and limitations of the S-CORE system will provide valuable insights for researchers exploring modern technologies and methodologies in communication and information management.

Scope and Limitations

The scope of this study includes the development and implementation of S-CORE, a web-based request approval and management system tailored for the Strategic Communications Office (SCO) of De La Salle University – Dasmariñas (DLSU-D). The study will facilitate user management, service request submission, task tracking, approval processes, communication management, and report generation offered by the platform to improve SCO's operational efficiency through key inputs, processes, and outputs. The inputs include registration details, login credentials, and user profiling with assigned roles through Role-Based Access Control (RBAC). The service request submission will ask for the requestor details and request details. The process

Commented [RS14]: IPO format -

Commented [CC15R14]: done

Commented [RS16]: study

Commented [CC17R16]: changed

begins with user management, which covers registration, authentication, and role assignments. Service request submission, task tracking, approval processes, communication management, and report generation follow. The task tracking will encompass a list of the requests, details, assigned units, deadlines, and statuses. The approval processes incorporate approval workflows. The approval workflow for the decision for the requests will undergo the assessment of the secretary and the unit involved if it's feasible and if the office will take on the request, refuse, or accept it with modifications. The approval workflow for the finalization of tasks will undergo the review of the director. Communication management will provide real-time status updates of the requests and tasks via web app notifications and email alerts. The report generation comprises of a compilation consisting of records of accomplishments, projects, and events from the requests and task outcomes in daily, monthly, and quarterly formats, exportable in PDF and Excel. Only the secretary and director will have permission to generate these reports to ensure security and proper data management. The outputs constitute confirmed, revised, and denied requests, real-time status updates, task completions, and generated reports. This will enable institutional offices, student organizations and other stakeholders to receive, evaluate, monitor and manage their requests efficiently. The study's design, development, test, deployment, and evaluation are covered to make sure that the system meets ISO standards.

The study is limited to the Strategic Communications Office and does not extend to other university departments. It focuses on a web-based platform and does not include the development of a mobile application. Integration with external third-party software and short message service (SMS) is not covered. The study will not include the application of search engines, artificial intelligence, chatbots, financial transactions or payment processing, writing and proofreading assistance, social media management, email management, and features for handling, designing,

editing photo, video, documents, and other collateral materials for publication materials. Additionally, the study's findings and implementation are based on the workflows and operational structure of SCO DLSU-D and may not be directly applicable to other institutions. Constraints such as data availability, user adoption, and technological limitations may also impact the scope of the system's functionalities.

Definition of Terms

To better understand this study, the following terms are defined in the context of this research:

Approval Workflow – An official process wherein decision of service requests undergo assessment before acceptance or rejection and finalization of tasks undergo a series of reviews before publishing or sending to relevant entities.

Dashboard – a data visualization tool within a system, usually situated in the default or home page, which serves as a comprehensive overview and summary of all statistics, as well as urgent and essential information using user-friendly interface.

Institutional Offices – University offices who work with SCO, including the Office of the President (OP), Office of Student Services (OSS), Office of the Vice Chancellor for Academics and Research (OVCAR), Information and Communications Technology Center (ICTC), and Building and Facilities Management Office (BFMO), to name a few.

Performance Insights – Statistical reports and information provided by a system to review completed projects, pattern trends, and turnaround time to inform strategic planning.

Publication Materials – Electronic or printed materials produced for the promotion, recognition, or publication of organizational information, including posters, social media posts, and brochures.

Request and Approval Management System – An automated computer program that oversees the submission, processing, tracking, and approval of service requests within an organization for greater efficiency and less manual intervention.

Request Tracking System – A module in systems that allows users to monitor the status of their submitted requests in real time.

Resource Allocation – The process of allocating personnel, time, and materials efficiently to accomplish tasks within an institution.

S-CORE – An online request approval and management system suggested in this research, an abbreviation for SCO – Creative Optimization for Requests and Engagement, which is intended to automate the workflows of SCO, enhance request processing, and enhance communication among stakeholders.

Stakeholders – Groups or individuals who have vested interests in the operations of the Strategic Communications Office, including university offices, student organizations, faculty, and staff.

CHAPTER 2

REVIEW OF RELATED LITERATURE

Commented [RS18]: synthesis, CF and studies matrix

Commented [RS19R18]: Chapter 3 - start

Commented [MR20]: include introductory sentences (at least 2-3) about this chapter

This chapter consists of the comprehensive review of related literature and studies relevant to the study which the researchers meticulously chose and discussed to further build, investigate, and expound the foundations and implications of this research. The contents of this part of the paper justify the need, importance, and contributions that the study will bring to the community, to the professional sector, and to the field of Information Technology.

Inefficiencies, delays, and miscommunications are challenges of traditional request approval workflows due to reliance on manual processes such as email exchanges and spreadsheets. Exacerbating these challenges are manual or paper-based systems, causing delays in request processing, poor tracking of request statuses, and difficulty ensuring compliance with organizational policies. These methods are prone to slow response times, low productivity, and a lack of transparency, making it difficult for organizations to track the status of requests effectively. Bharadia et al. (2021) emphasize that outdated systems with tasks such as approvals hinder operational efficiency, leading to bottlenecks and reduced productivity. They developed a Purchase Request Management System (PRMS) which addresses these issues by centralizing the approval workflow, enabling real-time tracking, and automating purchase records for easier reporting and auditability. This system not only streamlines the process by reducing processing time but also enhances transparency and accountability, allowing users to monitor the progress of their requests. However, challenges remain in integrating the PRMS with existing software

systems, such as financial or inventory management tools, and in overcoming user resistance to change or inadequate training. Furthermore, scalability can be a concern depending on the system's architecture. On the other hand, the PRMS provides significant advancement over traditional workflows offering a more efficient and transparent solution to procurement management despite the limitations. Through automation, real-time tracking, and improved communication, the S-CORE system will be developed to streamline request management in response to the impediments. By eliminating the need for manual interventions, the system enhances efficiency by ensuring requests are routed promptly to the appropriate personnel while enabling stakeholders to monitor progress transparently. Additionally, its integrated communication features, including automated notifications and task tracking, address the common issue of poor coordination in traditional workflows. While such digital solutions offer significant improvements, their success depends on proper implementation, user adoption, and integration with existing organizational processes.

Kristianto et al. (2022) demonstrated these challenges in their development of a web-based helpdesk system for PT. TH Indoplanations, where reliance on Excel-based reporting and email-dependent approvals caused bottlenecks in resolving technical issues. Their study employed the Rapid Application Development (RAD) method to create a centralized platform with role-based access and automated workflows, significantly reducing processing delays and improving coordination between stakeholders. However, while their system addressed immediate inefficiencies through iterative prototyping and PHP-MySQL integration, limitations such as the use of the Bubble Sort algorithm for request prioritization—an inefficient choice for scaling workloads—and insufficient emphasis on user adoption strategies highlight gaps in scalability and adaptability. For institutions like DLSU-D's Strategic Communications Office (SCO), which faces

similar challenges with manual tracking and email overload, the researchers' work underscores the potential of RAD-driven systems to streamline approvals but also illustrates the need for dynamic prioritization mechanisms (e.g., urgency-based queues) and robust training protocols to ensure sustainable adoption. These insights reinforce the importance of balancing technical innovation with user-centric design and scalability in modernizing request management workflows.

Mercaral (2023) highlights critical challenges in traditional approval workflows through a case study on motorcycle loan management, where manual processes, fragmented communication, and reliance on physical documentation led to delays, operational inefficiencies, and high costs. To address these, RUBI Grand Showroom Corporation implemented a web-based system integrated with data mining techniques (clustering and classification) and agile Scrum methodology, achieving an 89.19% reduction in processing time and ₱2.1 million in annual savings. The system's success stemmed from automating credit risk analysis, centralizing real-time data access, and deploying role-based modules, which streamlined stakeholder collaboration and decision-making. These findings underscore best practices such as adopting iterative development frameworks, embedding data-driven automation, and prioritizing financial viability analysis to justify institutional investments. However, Mercaral (2023) also emphasizes challenges like scalability limitations and the need for phased technological upgrades, as seen in RUBI's planned integration of augmented reality. For systems like S-CORE, this study reinforces the importance of modular design, user-centric dashboards, and agile adaptability to balance functional suitability (e.g., ISO/IEC 25010 compliance) with institutional scalability, while cautioning against overlooking user adoption barriers in academic settings.

The development and implementation of a request approval and management system are well-grounded in several established theoretical frameworks that explain their efficiency,

adoption, and communication processes. Systems Theory, more particularly Systems Management Theory, provides a framework understanding how interconnected elements within an organization play their part in streamlining request processing. Organizational Communication Theory further emphasizes the imperative role that structured communication plays in guaranteeing smooth approval workflows. Combined, these theories provide a basis for designing and refining S-CORE, a request approval and management system specifically suited to the requirements of DLSU-D's Strategic Communications Office (SCO).

Systems Management Theory perceives organizations as a system of interdependent and interrelated elements that must work together to attain efficiency. Regarding request approval and management systems, this theory highlights how various subsystems like users requesting, certain units reviewing, and decision-makers approving need to communicate effectively to ensure a seamless workflow. Key principles of Systems Management Theory that can be applied to request approval and management systems are Systems Thinking, Synergy, Feedback Loops and Contingency Approach. System Thinking refers to the idea that processes for approval of requests do not function independently but as part of a greater organizational structure involving several stakeholders. Synergy ensures that interrelated subsystems, i.e., request submissions, approval tracking, and notification systems, collaborate to improve overall efficiency. Feedback Loops shows importance in integrating mechanics that will provide real-time status updates to users and team members, ensuring that requests are processed efficiently with minimal to no delay. Lastly, Contingency Approach focuses on adapting the system based on the organization needs, such as customizing the approval workflows to fit the SCO's structure (Knyazeva 2020). By applying the core principles of the Systems Management Theory, S-CORE system can be designed as a

streamlined, self-regulating system that reduces bottlenecks in the approval process, improves transparency, and optimizes resource allocation.

Effective communication is core to effective request approval management. Organizational Communication Theory emphasizes the fact that structured communication helps improve request approval speed, error minimization, and cooperation. In request approval and management processes, systematic communication ensures there will be proper documentation and categorization of tasks, ensuring organizations are able to track and process approvals smoothly (Zink 2020). Similarly, team members are notified instantly for new request approvals or service procurements, resulting in timely responses and minimizing workflow bottlenecks (Deng et al. 2021). In addition, open decision-making among team members and workflows ensures accountability and reduces miscommunication, resulting in enhanced efficiency in request processing. In connection with the creation of S-CORE, organized communication plays a vital role in approval requests and other activities associated. To support the Organization Communication Theory, the system must have the capability to send real-time alerts within the system so that users and members of the team will be notified regarding submitted request approvals (Musheke & Phiri 2021). Secondly, the system must be a centralized platform from which requesters and approvers can monitor the status of requests, increasing transparency and accountability. Finally, having Role-Based Access Control (RBAC) in the system will guarantee that only the permitted unit or team member will process certain approvals, minimizing security risks and disorganized workflow (Horan, Nucci, & Sevilla n.d.).

The integration of a well-developed request approval and management system is fundamental for improving workflow efficiency, transparency, and security within an organization. By applying key theoretical foundations, S-CORE is designed to ensure that all

subsystems work cohesively. With Systems Management Theory, the system will function as a well-organized framework, reducing bottlenecks and optimizing resources. Organizational Communication Theory reinforces the need for real-time updates, clear documentation, and streamlined coordination, ensuring requests and approvals are processed efficiently. Additionally, role-based access control strengthens security and accountability, limiting approval to authorized and assigned team members only. By aligning these principles, S-CORE will provide a reliable, adaptive, and user-friendly solution that meets the specific needs of DLSU-D's Strategic Communications Office, ultimately enhancing operation effectiveness.

Request approval and management systems are designed to streamline decision-making and ensure that all tasks, from initiation to completion, are carried out in an efficient way. These systems are important for maintaining order, accountability, and efficiency in organizational activities. In the context of the Strategic Communications Office (SCO) of DLSU-D, a structured request approval and management system is essential for the management of the creation, reviews, and dissemination of materials to ensure that all communications are in line with the university's strategic objectives. SCO plays an important role in the management of the university's communications strategies, which include all aspects of public relations, such as but not limited to the creation of promotional materials, social media content, and event announcements. However, current manual processes often lead to inefficiency such as delays, miscommunication, disorganization, lack of transparency, and administrative bottlenecks. Structured digital request approval and management system, such as S-CORE, is necessary to face these challenges, ensuring that all tasks are tracked, approved, and efficiently completed.

Request approval and management systems are digital tools designed to streamline the processes of submitting, reviewing, and approving various types of requests within different types

of organizations (Atlassian n.d.; ServiceNow n.d.). These systems ensure standardized approval processes, promoting consistency and fairness within business operations. The types of approval flows are sequential, parallel, and mixed. By delivering a clear and consistent route for making decisions, these systems keep things aligned within an organization (Cflow 2024). Elements of a typical approval workflow are task submission portal, defined approvers, established permission levels, set timelines, automated notifications, and activity log (Vendr 2024). Besides, these systems cut down on manual approvals, making them more transparent and accountable. Team members can track the status of requests and monitor the assigned team for each task. For instance, the Land Administration and Management System (LAMS) in the Philippines has been effective in managing land records and ensuring efficient delivery of land transactions and information services (Land Management Bureau n.d.). Some of its functionalities are computerized verification and approval of surveys, and a built-in transaction tracking system (TTS) for more transparency in land transactions (i.e. application status and actions). Additionally, implementation of a document tracking and management system in a Philippine government agency shows that it will improve document generation, approval, distribution, and storage, enhancing transparency and accountability (Dayrit et al. 2024). Recognizing DLSU-D's Strategic Communications Office's need for a structured request approval and management system, the core importance of the system is recognized as crucial for the office. Implementing S-CORE will streamline the approval process, reduce bottlenecks, and improve the overall workflow within the team. The structured system provided by the SCO will enhance transparency, allowing team members to track their progress and adhere to internal policies and regulatory requirements.

In the evolving digital landscape, organizations are transitioning to web-based request approval and management systems to make operations more efficient, automate processes, and

facilitate communication. Numerous studies have found that these systems have been implemented and utilized in both corporations and institutions to show how web-based platforms decrease processing time, increase tracking, and provide smooth approval workflows. Through automation, organizations can reduce manual intervention, thus limiting errors and improving overall productivity. To gain insight into the use of automation in request approval and management systems, here are studies that analyze its effect on efficiency and organizational performance across various industries.

The web-based request approval and management in business and institutional settings highlights here the use of advanced technologies to streamline processes. Shah et al. (2022) introduced a web-based task management system for improving group work collaboration, particularly in academic institutions. They implemented work progress, group task management, and email notification features using the Waterfall methodology with four phases: requirement gathering, analysis, design, and implementation. Each of the cases was successfully evaluated through functionality testing. They recommended the ability to handle multiple tasks and files at once for future work. Pratt & Gillis (2023) discussed workflow automation, emphasizing its role in automating repetitive tasks and improving efficiency in corporate environments. Workflow automation will be applied in the study through the in-app and email notifications for service request submission, approval processes, communication management, and report generation. Because of user registration, requestor details won't be repetitive and office details such as description and telephone number will be automatically inserted based on the office they entered. Extra steps like informing the requestor about every step in their request will not be needed anymore. In addition, Purwanto et al. (2022) developed a web-based program approval application system for a corporate environment that shows the application of digital solutions to the

management of approval processes. Unified Modeling Language (UML) was used for its initial design with the use case diagrams, activity diagrams, sequence diagrams, and class diagrams. For programming, PHP and MySQL were utilized. Subsequently, the researchers aimed for black box testing and saw that it's in accordance with the expectations.

Web-based systems are getting popular in the Philippines because of how it helps eliminate the need for papers which affects the environment. Bajao et al. (2023) developed a web-based faculty development management system, which highlights the digitalization of faculty-related processes. It is an online evaluation system with user management and report generation. HTML, CSS, Bootstrap, PHP, and MySQL were used for its development. To ensure its smooth implementation, they followed the Agile Model of the Software Development Life Cycle (SDLC) as a blueprint or a guide with unit testing, integration testing, and system/alpha testing.

The local studies in the Philippines focus on the development and implementation of digital approval systems within universities of the Philippines. Velasco et al. (2024) created an online management system for academic document requests, showcasing the integration of digital solutions in universities. Castro et al. (2022) developed DocTrack, a dynamic document tracking system for the University of Northern Philippines, emphasizing the importance of digital approval systems in educational institutions. The Waterfall model was modified as it is more appropriate in the system objectives. Its evaluation adapted some characteristics from the ISO 25010:2011 model. Lastly, they recommended that the system must be accompanied by proper equipment and training must be carried out for regular operations and maintenance. Meanwhile, digital-based approval systems were not only implemented in universities, Taruc et al. (2023) introduced Docu-Go, a system for barangay document requests also employing the Modified Waterfall Model and ISO 25010, demonstrating the potential for similar systems in university settings. The researchers

recommend user research, usability testing, and incorporating user feedback along with involving IT experts.

Hottat, Leroi-Werelds, and Streukens (2023) highlight the necessity of service automation within organizational contexts, with a focus on a contingency approach to identifying when automation adds to or detracts from value. Their research proposes a Framework of Automated Service Interactions (FASI), outlining factors that affect value co-creation or destruction in automated systems. Though automation will enhance efficiency and minimize human intervention, they assert that organizations need to weigh carefully service contexts and tasks to maximize its advantages. The project had three phases: diary study with follow-up interviews, consultation of academic experts, and storyboard study. For the first phase, they applied the Gioia methodology for the data analysis to code the data gathered from the participants. On the other hand, the data collected from phases two and three were used to enhance the initial FASI. The researchers' findings point out that automating complex approval processes without evaluation can result in inefficiencies instead of enhancements.

Similarly, Ashish et al. (2021) focused on designing a Web-Based Expense Approval System, examining its efficiency in corporate expenditure management. Their study details how the systems help track expenses, impose policy compliance, and automate the approval process by incorporating various levels of authorization. The method ensures efficient financial approvals while keeping the organization in check through accountability. The study highlights web-based automation as a means of minimizing human errors and enhancing financial governance.

At an institutional level, Bacud and Siddayao (2024) investigated the efficiency of an Online Request System for Issuance of School Academic Records at Maila Rosario College. Their research highlights how the system can automate academic record requests by substituting manual

steps with a secure, easy-to-use online system. They employed the Sashimi Model which is a fusion of the Iterative and Waterfall method. Some of the major components of the system are user login, real-time monitoring, safe document delivery, and integration into the database, all of which enhance administrative efficiency and data security. The research also compares the system against ISO 25010:2011 Software Quality Standards, wherein they scored maximum marks under functionality, usability, and maintainability categories. Their conclusions further validate the concept that digital transformation of educational institutions increases service delivery and adheres to current technological standards.

Collectively, these studies emphasize the significance of automation in request approval and management systems. They identify essential functionalities like automated notifications, workflow tracking, and data-driven decision-making, which help enhance organizational efficiency and service delivery. Though these studies substantiate that web-based request approval and management systems lower manual workloads, increase transparency, and make decision-making processes quicker, Hottat et al. (2023) recommend that organizations should examine service contexts cautiously before total automation. This underlines the necessity of a strategic approach to automation so that digital approval systems maximize efficiency and do not bring unintended inefficiencies. With increasing institutions and organizations embracing these technologies, more research on how to optimize automation approaches will be critical to achieve the maximum potential of digital transformation in request management.

The digitalization of request approvals in Philippine universities has been a focus of recent studies, aiming to enhance efficiency and transparency. Velasco et al. (2024) developed an online management system for academic document requests, illustrating the shift towards digitalization in universities. Castro et al. (2022) introduced DocTrack, a system that streamlines document

tracking and approval processes. These studies underscore the adoption of digital solutions to modernize request approval processes, aligning with global trends in educational institutions. The integration of such systems not only improves operational efficiency but also enhances the overall academic experience by making processes more accessible and user-friendly.

Workflow automation in request approval processes has significantly transformed both corporate and academic institutions through streamlining processes and reducing administrative burdens. As organizational managements transition into digital solutions, automated systems for approvals provide essential contributions in raising efficiency levels, reducing labor involvement, and enhanced decision-making (McMillan 2025). By substituting old manual procedures with automated solutions, organizations enhance accountability, transparency, and overall business effectiveness. Increased use of workflow automation indicates its significance in contemporary institutions, putting emphasis on well-designed and dynamic approval management systems (Jacinto 2024).

Within the corporate environment, automation of workflows has been proven to improve approval and overall efficiency. Yossy and Darmawan (2023) designed a Web-Based Document Workflow Management Information System aimed at correcting inefficiencies associated with manual approval of documents that previously used email and resulted in delays in processing. Their system facilitated automation of routing documents to direct approval requests to the correct people while decreasing the level of human intervention. Furthermore, features for real-time tracking allowed users to track statuses of requests to decrease uncertainties and increase accountability. Evaluations in black box testing, eight golden rules interface design evaluations, and UAT evaluations were successfully accomplished. Similarly, Odewole (2021) conducted a case study on enhancing the approval request process in an enterprise application. The research

explored how employees utilized workflow applications for requests like loans, procurement, and vendor payments. Results indicated inefficiencies such as challenges in tracking request statuses and excessive information requirements, which prompted employees to fall back on manual approval processes. To overcome these issues, the new system incorporated streamlined request flows, information sections categorized, and a dashboard featuring real-time tracking analytics. Through this, the organization saw an increase in processed requests of 25% and cost savings, demonstrating the significance of streamlining approval workflow systems to improve efficiency and user uptake.

Academic institutions likewise benefit from automation of workflow in request approval processes. Castro et al. (2022) developed DocTrack, as previously mentioned, a dynamic document tracking platform designed for the University of Northern Philippines to standardize document approvals and facilitate paperless transactions. DocTrack operates as a central repository where one can submit, monitor, and manage approval requests, providing a smooth and transparent workflow. The research found that using DocTrack enormously enhanced administrative processes in eliminating duplicate work, automating notifications, and ensuring access controls. By adhering to international standards for electronic transactions, DocTrack proved the power of workflow automation in enhancing institutional efficiency and sustainability.

The application of workflow automation within request approval and management systems has been shown to be a revolutionary means of enhancing efficiency, minimizing the burden of manual effort, and providing greater transparency across corporate and educational institutions. The conducted study by Yossy and Darmawan (2023) and Odewole (2021) captures how automated workflows for approvals eliminate the need for human interference and enable real-time decision-making within corporate environments. At the same time, local studies by Castro et

al. (2022) identify how digitalization facilitates document tracking and simplifies administrative processes in universities. Such findings reinforce that automation minimizes processing delays, enhances operational effectiveness, and enhances security through authentication strategies and access controls.

Workflow automation has emerged as an important tool for enhancing the efficiency of work by streamlining repetitive tasks and processes. Automation enables the project to allocate more effectively and improve the output. Cabaobao et al. (2024) conducted a study to evaluate the efficiency of workflow automation in a government agency in the Philippines, grounded in the Technology Acceptance Model (TAM). The study involved an automation process through questions using Google Forms. Key findings indicate that automation tools significantly enhanced the efficiency of key work processes in terms of speed, accuracy, and collaboration. The studies highlight the strengths and limitations of automation, and improved task-specific satisfaction without enhancing overall job satisfaction by applying the Technology Acceptance Model (TAM) in the government. Overall, the study is about understanding the workflow automation in a government setting by providing proof, evidence, and recommendations that can inform future research and policy decisions.

In relation to the development of the S-CORE system for DLSU-D's Strategic Communications Office (SCO), workflow automation is consistent with the university's digital transformation and operational efficiency. Through the automation of service requests and approvals, S-CORE will cut down on manual inefficiencies, enhance tracking processes, and improve communication among stakeholders. The system will guarantee structured decision-making, cutting down on delays and enhancing accountability. As institutions keep adopting

digital solutions, S-CORE is a steppingstone in streamlining request approval processes, affirming the necessity for flexible and technology-driven management systems.

Implementing digital request approval and management workflow systems in government and educational institutions can significantly enhance efficiency and productivity. A case study on the City College of Tagaytay (CCT) highlights the benefits of such systems, particularly during the pandemic. The CCT's online request system for student credentials, developed using Agile methodology, proved to be more convenient and safer for students, underscoring the importance of digital solutions in modern educational settings (Abang et al. 2022). Best practices in implementing request approval and management systems include ensuring user-friendly interfaces, integrating robust security measures, and providing comprehensive training for users (Acido & Kilongkilong 2022). However, challenges such as resistance to change, technical issues, and the need for continuous updates and maintenance can hinder successful implementation (Saldaen et al. 2021). Addressing these challenges requires strong leadership, adequate funding, and ongoing support to ensure the system's sustainability and effectiveness (Metz et al. 2020).

Alade et al. (2022) emphasize that implementing a request approval and management system requires a strategic approach to ensure workflow optimization. Best practices in system deployment include automation to minimize manual workload and errors, role-based access control (RBAC) for security and efficiency, seamless integration with existing systems to maintain data consistency, and real-time tracking with notifications to enhance transparency. Additionally, a standardized approval hierarchy and a user-friendly interface are essential for efficient decision-making and system adoption. However, despite these advantages, challenges such as employee resistance to digital transition, integration complexities with legacy infrastructure, data security risks, process bottlenecks, and system downtime can hinder successful implementation.

Organizations must proactively address these issues by ensuring comprehensive training programs, robust security frameworks, and scalable system architecture to accommodate future growth. When properly implemented, request approval and management systems significantly enhance workflow efficiency by reducing delays, increasing accountability, and providing data-driven insights for process improvement. However, failure to address resistance to change, integration limitations, and security concerns can undermine these benefits, leading to inefficiencies. The study provides a strong foundation for understanding these best practices and challenges, reinforcing the need for a structured approach in designing request approval and management systems that align with organizational needs and long-term operational goals.

Recent studies underscore the transformative potential of web-based systems in institutional process automation. Kommey et al. (2022) demonstrated this through AccSOFT, a centralized accreditation management system that streamlined workflows via a client-server architecture (ReactJS/Node.js with MongoDB), automated alerts (cron jobs and email notifications), and robust security protocols (RBAC, XSS/CORS mitigation). These best practices align with the needs of systems like S-CORE, particularly in centralizing data storage and automating reminders to reduce delays—a critical feature for institutions like DLSU-D’s Strategic Communications Office (SCO), which currently relies on fragmented email-based processes. However, challenges remain, such as user adoption barriers during transitions from manual methods and scalability limitations tied to single-database architectures, as seen in AccSOFT’s reliance on MongoDB. Additionally, integration gaps with third-party tools (e.g., Microsoft Teams) highlight the need for compatibility with systems like S-CORE to ensure seamless institutional workflows. The study further reveals that such systems enhance efficiency by minimizing manual tracking and improving transparency through real-time dashboard features directly applicable to SCO’s goal of optimizing request

approvals. While AccSOFT did not explicitly evaluate ISO/IEC 25010 compliance, its functional suitability (e.g., CRUD operations) and interaction capabilities mirror S-CORE's objectives, emphasizing the importance of modular design and scalability to meet evolving institutional demands. These insights underscore the necessity of balancing technical innovation with user-centric training and phased implementation to achieve workflow optimization in complex organizational settings.

Dela Fuente et al. (2023) examined the implementation of Project Klinik, a request approval and management system designed to streamline workflow processes in healthcare settings. The study identified several best practices that contribute to workflow optimization, including automation and standardization of request handling, a user-friendly interface to enhance adoption, integration with existing systems for seamless operations, and strict adherence to security and compliance regulations. These elements collectively improve efficiency, reduce manual errors, and ensure timely processing of requests. However, the study also highlighted key challenges in implementation, such as user resistance to transitioning from manual to automated systems, difficulties in customizing the platform to meet diverse organizational needs, and technical downtimes that may disrupt operations. In relation to S-CORE's research on workflow optimization, Project Klinik provides valuable insights into how automation can enhance efficiency. However, its challenges reveal areas requiring further attention, particularly in managing user adaptation and ensuring system flexibility. Addressing these issues could lead to more effective request management solutions that further optimize organizational workflows.

The implementation of web-based request approval and management systems has been widely recognized for optimizing organizational workflows through automation, centralized tracking, and real-time analytics. Studies such as the Integrated Library Management System (ILMS) highlight

best practices like modular design, role-based access control, and compliance with ISO/IEC 25010 standards to ensure functional suitability and usability. These systems reduce manual redundancies, minimize errors, and enhance transparency by automating approval chains—principles directly applicable to the development of S-CORE for DLSU-D's Strategic Communications Office (SCO). However, challenges persist, particularly in user adoption and technical integration. Ayo et al. (2023) emphasize that resistance to change, often rooted in familiarity with traditional methods, necessitates stakeholder engagement and phased training—a critical consideration for SCO's transition from email-based workflows. While ILMS underscores the importance of centralized dashboards and automated reporting, it underemphasizes communication-specific needs, such as integrated commenting tools or revision policies for branding compliance, which are vital for SCO's multimedia and publication workflows. Furthermore, the researchers caution against underestimating scalability and flexibility in system design, noting that rigid architectures may hinder adaptability to evolving organizational demands. For S-CORE, these insights validate the need for a tailored solution that balances automation with SCO's unique requirements, such as real-time collaboration features, revision tracking, and stakeholder-specific access tiers. By addressing gaps in existing literature—such as the lack of focus on communication-centric workflows—S-CORE aims to not only streamline SCO's operations but also set a precedent for workflow optimization in academic institutions.

Golo and Encarnacion (2024) explored the transformative potential of web-based systems in their study on Siargao Island's vehicle rental management, identifying key best practices such as user-centric design, automated workflows, and real-time tracking to address inefficiencies in manual processes. Their findings emphasized the role of automation in reducing errors and processing times, alongside the importance of stakeholder collaboration to align operational

goals—practices directly applicable to the development of S-CORE for DLSU-D’s Strategic Communications Office. However, the study also underscored challenges, including resistance to technological adoption and data security risks, which highlight the need for S-CORE to incorporate phased training programs and robust role-based access controls. Additionally, Golo and Encarnacion’s insights into centralized platforms improving resource allocation and transparency align with S-CORE’s objectives to streamline task delegation and communication workflows. By integrating these lessons, S-CORE can optimize SCO’s operational efficiency while addressing contextual gaps such as scalability and institutional adaptation, ensuring a sustainable digital transformation aligned with ISO/IEC 25010 standards.

The reviewed literature and studies collectively underscores the transformative potential of web-based request approval and management systems in addressing inefficiencies inherent in manual workflows, particularly for institutions like DLSU-D’s Strategic Communications Office (SCO). By integrating automation, user-centric design, and real-time tracking—as exemplified in systems like DocTrack (Castro et al. 2022) and ILMS (Golo & Encarnacion 2024)—S-CORE aligns with proven strategies to reduce delays, enhance transparency, and streamline stakeholder collaboration. Theoretical foundations, such as Systems Management and Organizational Communication Theories, reinforce the need for cohesive subsystems and structured communication, ensuring S-CORE’s adaptability to SCO’s operational dynamics. While challenges like resistance to change and scalability persist, lessons from existing implementations emphasize the importance of phased training, robust security protocols (e.g., RBAC), and ISO/IEC 25010 compliance to ensure functional suitability and institutional resilience. Ultimately, S-CORE represents a tailored solution poised to modernize SCO’s workflows, balancing technological innovation with the practical demands of academic communication management.

The related literature and studies are for the development of a web-based request approval and management system, such as the S-CORE system. The collected literature and studies will serve to provide a comprehensive overview of the existing research and collectively align with the development goals of the S-CORE system. Literature consistently emphasizes the benefits of digitalization and automation in enhancing the approval process, reducing administrative burdens, and improving transparency. The importance of request approval and management systems is essential in streamlining the organizational process, ensuring accountability, and enhancing its efficiency. This system is for SCO, which manages multiple tasks such as publication matters, promotion, and posters. (Atlassian, n.d.; ServiceNow n.d.) The adoption of web-based request approval and management systems has been shown in the collected studies. It shows how to improve operational efficiency, reduce manual intervention, and enhance transparency. A successful system in academic institutions highlights its potential to streamline and improve service (Bacud and Siddayao 2024; Castro et al. 2022). Workflow automation supports both corporate and academic institutions in terms of reducing administrative work and efficiency. The literature emphasizes the design that minimizes the risk of over-automation (Hotta et al. 2023).

Overall, the literature aligns with the development of the S-CORE system, as it identifies the gap in the creating the S-CORE system for SCO. The system also features automated workflow, real-time notification and role base access control. Also, the literature demonstrates the best practice in streamlining request approval processes, also the S-CORE will help to enhance the transparency and efficiency of the system.

The theoretical foundation of these systems in the related studies are grounded in Systems Management Theory and Organizational Communication Theory. Systems Management Theory highlights the interconnectedness of organizational elements and the need for effective

communication to streamline request processing (Knyazeva 2020). Organizational communication Theory underscores the importance of structured communication in improving approval workflows, minimizing errors and enhancing cooperation (Musheke and Phiri 2021). These theories provide a robust framework for designing and refining the S-CORE system to meet the specific needs of DLSU-D's SCO.

Observed evidence from case studies supports the benefits of digital request approval and management systems. For instance, the Land Administration and Management System (LAMS) in the Philippines has been effective in managing land records and ensuring efficient delivery of land transactions (Land Management Bureau n.d.). Similarly, the Document Tracking System in Philippine government agencies has improved document generation, approval, distribution, and storage, enhancing transparency and accountability (IRE Journals 2025). Studies also show that web-based request approval and management systems decrease processing time, increase tracking, and provide smooth approval workflows, thereby minimizing human errors and enhancing financial governance (Hottat, Leroi-Werelds, & Streukens 2023; Ashish et al. 2021). Relating this to our study on the impact of S-CORE on organizational efficiency, the literature provides great evidence that digital request approval and management systems greatly improve operational performance. These systems do not only make processes easier, but they also enhance transparency, accountability, and overall efficiency and are in line with the objectives of digital transformation. The studies are important since they offer empirical evidence and theoretical support for the adoption of such systems, with their contribution to minimizing manual workloads, enhanced transparency, and accelerated decision-making. This emphasizes the importance of embracing digital tools in driving greater efficiency and effectiveness in organizational operations.

To further illustrate the relevance and contributions of the reviewed studies, a matrix summarizing the literature, authors, features, similarities, and differences is provided in Appendix B: Matrix of the Related Review of Literature and Studies.

Conceptual Framework

Figure 1. Conceptual Framework

Commented [RS21]: CONCEPTUAL FRAMEWORK - immediately after the figure

Figure 1 elaborates on the conceptual framework of the S-CORE system; it shows here the functionalities and their interaction with the website. The diagram provided visually represents the system, capturing the various elements and processes it integrates, offering a clear and organized overview of its structure and operations.

Illustrated in the figure are the components involved in the study, which utilize the IPO model—a framework consisting of three stages: the input, process, and output. This model aligns

with the objective of our research and outlines the S-CORE system on how it will manage the services request and approvals within the Strategic Communication Office (SCO) of De La Salle University-Dasmariñas (DLSU-D). The IPO model will be the guide in understanding the system's functionality, from the initial submission of the request to the final output of the approved or rejected request.

The initial phase in the research, known as the "input stage," is crucial for collecting and processing information and variables required for the development of the S-CORE system. This step guarantees that the correct and accurate information required for the successful fulfillment of the system's intended end is gathered. It is directly in line with the essential aspects of the platform's core functionalities and lays the groundwork for everything that follows. This phase entails User Information, in which users enter their individual or institutional data to register an account in the system. It is the collection and management of data, including registration and login process. This is followed by Request Details and Approval Details, upon login, users can then use User Request Submission, which enables them to request services and approval directly from the Strategic Communications Office. These requests frequently call for more documentation, taking them to the Request and Approval Document Asset part, whereby users submit associated files or approvals for validation, ending the input process. All these operations like registration, login, request submission, approval attachment, updates of status, and completions are important input elements that power the S-CORE system to operate effectively and move to the processing stage.

The process phase is where the execution of the S-CORE system's functions occurs. It is tasked with processing the data gathered from the input phase and performing the core functions that characterize the platform's performance. The processing phase consists of several important components that determine the smooth flow of requests throughout the system. After thorough

planning on how the system would be constructed, data gathering and analysis are conducted to ensure an efficient approach in the system developments. In this stage, the program and the database for the system are designed and produced, which are then synchronized with the Strategic Communications Office's ongoing processes. Afterwards, System Testing is performed to confirm that all functionalities—such as request handling, user access, and report generation—work correctly and meet performance expectations. Within the system's live environment, core features such as User Management will become operational. This will include User Registration, where users will submit their personal or institutional information to create accounts, and User Login, which authenticates users based on their credentials. Role Assignment follows, where administrators assign roles and manage access levels, ensuring security and proper task delegation. Another critical component of the processing phase is the Request Approval Workflow, which automates the routing of submitted service requests to the appropriate approvers. The secretary will sort requests for designated units, and automated notifications are sent to alert the approvers. Each request is reviewed, and decisions are made to either approve, reject, or request modifications. Once a request is approved, Task Management becomes active. This involves breaking down the request into smaller tasks, assigning them to responsible team members, and tracking their progress within the system. Communication and collaboration are facilitated within the platform to ensure smooth task execution. After tasks are completed, the Request Approval Completion stage is then initiated, where the requestor will check for accuracy and completeness, providing feedback or final approval. Lastly, the system enables Report Generation, where compiled requests and task data will be analyzed to produce detailed reports. These reports offer insights into performance metrics, status updates, and overall system activity, and can be exported for documentation or presentation purposes. Through this structured process, the S-CORE system

ensures that each request is efficiently managed, approved, and documented with transparency and accountability.

The output stage will present the final results of the S-CORE system's operations, which will include completed service requests that will either be approved or rejected, collaterals that are products of some of the requests, as well as system-generated reports. The most important outcome will be the full implementation of the S-CORE System for the Strategic Communications Office of De La Salle University-Dasmariñas. This web-based system will be developed to promote transparency, simplify service request processes, and enhance communication and operational efficiency within the department. The system will support organized data handling, structured workflows for request approvals, coordinated task assignments, and the creation of detailed reports. It will ensure that each request will be addressed properly, approvals will be managed promptly, and tasks will be executed with accuracy and responsibility. Real-time status tracking and automated reports will also assist administrators in monitoring the system and making well-informed decisions. After the system is implemented, user feedback will be collected to evaluate whether the platform meets their expectations and needs. This evaluation phase will be essential in identifying areas for further enhancement. If improvements are required, the feedback will be used to inform a return to the processing stage where updates and adjustments will be made to refine the system's overall performance and user experience.

CHAPTER 3

METHODOLOGY

This chapter of the study will serve as the comprehensive roadmap that outlines the key components that are necessary for the development of S-CORE System. It contains the research design, software methodology, sampling method, data gathering instruments, statistical analysis and the sample survey questionnaire used by the proponents.

Research Design

The researchers will utilize a mixed method research design and descriptive developmental research to thoroughly evaluate the effectiveness of S-CORE, a request approval and management system for the Strategic Communications Office (SCO) of DLSU-D. Mixed method research, as defined by George (2021), is a mixture of quantitative and qualitative research to answer research questions more thoroughly. This strategy combines numerical data and statistical analysis of quantitative research with detailed, contextual findings of qualitative research to offer a fuller picture than either method separately. Additionally, mixed method research strategically combines meticulous quantitative and qualitative research techniques to leverage the strengths of both. This strategy permits researchers to adopt a variety of methods, employing inductive as well as deductive reasoning, and counteracting the drawbacks of purely quantitative and qualitative research with a complementary methodology that maximizes the strengths of each type of data and permits a fuller grasp of complex questions (Harvard Catalyst 2025). Moreover, with the use of descriptive developmental research design, specifically Type I, or Formative Research System-Based Evaluation, the researchers will be able to fully assess the performance of the study's system

Commented [MR22]: redundant

Commented [JH23]: include descriptive developmental research method

Commented [RS24]: JUSTIFY WHY MIXED?

S-CORE by its design, development, and evaluation. As defined by Cruz and Dizon (2021), Type I research design involves describing and analyzing the product development process used in a specific situation and evaluating the final product to determine its effectiveness and usability.

Commented [JH25]: pacheck eto ung descriptive

In connection with the study, this approach will enable the researchers to fully assess the performance of S-CORE by recording both the quantitative benefits in efficiency in operations and the experiences of the SCO stakeholders and staff. The quantitative aspect will involve collecting numerical data such as processing times, error rates, and overall system usage statistics. Additionally, a questionnaire using a Likert scale will be employed to determine how well the system adheres to ISO 25010:2023 standard. This data will help the researchers understand the tangible impact of S-CORE on the efficiency and productivity of the SCO team and requestors. Through the analysis of these findings, the researchers will be able to identify specific areas for improvement and quantify the benefits of the system.

On the other hand, the qualitative aspect will entail the collection of rich user feedback from the SCO employees using interviews and open-ended questions in the survey. This qualitative information will yield situational insights into the user experience, capturing the ways S-CORE influences day-to-day working, communication, and task management. Through the understanding of the individual experiences and perceptions of the users, the researchers will gain an understanding of any challenges or areas for improvement that cannot be captured using quantitative information only.

Moreover, with the use of type I descriptive developmental research design, or Formative Research System-Based Evaluation, the researchers will be able to thoroughly evaluate the performance of S-CORE by examining its design, development and evaluation. This research design focuses on an in-depth review of both the process and the product, allowing the researchers

to assess how well the system works within its desired institutional context. According to Cruz and Dizon (2021), Type I research entails describing and analyzing the development process employed in each situation and assessing the final product to measure its usability and effectiveness. Also, this design represents a conventional evaluation orientation where emphasis is placed on a specific program or system, as opposed to the general design methodology. This makes it especially useful for assessing systems such as S-CORE since results are product- and context-dependent. The approach will also enable the researchers to document the full development process of the system, citing challenges, good practices, and lessons to be used to shape future refinements and applications.

By combining quantitative information, including the decrease in processing times and error rates, with qualitative data generated through the interviews and focus groups, the researchers will be able to perform an in-depth assessment of how S-CORE enhances communication, task management, and overall productivity in the Strategic Communications Office. Employing this mixed method guarantees that the findings of the researchers are robust, reliable, and reflective of the diverse views and experiences of all concerned users. Not only does this comprehensive method ensure the confirmation of the effectiveness of S-CORE through quantifiable results but also guarantees that the system is useful and satisfactory in meeting the practical requirements and expectations of users.

Software Methodology

A software development methodology is a framework used to structure, plan, and manage the software development process. It aims to ensure the delivery of software in accordance with project specifications, within time and budget, and with minimized project risks (Nikitin 2024).

Commented [JH26]: and pacheck eto ung descriptive ren
nainclude ko na sa references ung gamit ko dito

The Agile software methodology of the software development life cycle (Figure 2) was chosen to be followed by the proponents of the study in developing the S-CORE Request Approval and Management system due to its ability to be flexible, adaptable, and interactive. The study by Bajao et al. (2023) used Agile software methodology in their study of a Student's Rating System for Teachers, highlighting the importance of being adaptive to evolving user needs and institutional processes. It showed how iterative development is crucial in responding to feedback from stakeholders, a feature that is vital in both academic and administrative settings. This precedent justifies the use of Agile in the current study, as SCO's requirements are dynamic and require continuous interaction with users as well as continuous improvement of system features.

The Agile software methodology is particularly advantageous for the study because of its iterative and flexible nature that allows for the continuous refinement of the system based on user feedback, ensuring that the requirement meets the specific needs of the SCO. By breaking the development process into an interactive cycle, this software methodology enables the team to focus on delivering functional increments such as user management request submission, approval workflow, and report generation.

The use of the Agile software methodology, thus, is in direct answer to the goals set forth in this study with the intention of designing a dynamic and user-adaptive request approval and management system for the Strategic Communications Office (SCO) of De La Salle University-Dasmariñas. Due to the intricate nature of the SCO's processes and its need for a centralized online system, the iterative approach of Agile allows for continuous interaction among end-users and developers across the development process. Each stage in system development—planning, requirements analysis, design, development, testing, and deployment—is an echo of the fundamental principles of Agile, namely its focus on flexibility, stakeholder involvement, and

incremental delivery. With continuous mechanisms for feedback and module testing, Agile allows for continuous adaptation of the S-CORE system to precisely meet the operational requirements of the SCO. Agile, thus, was not just an appropriate methodology for this project—it was a requirement in the pursuit of a flexible, efficient, and user-driven solution.

Figure 2 *SDLC Agile Software Development Model*

Modified model from W3SSchools at <https://www.w3schools.in/sdlc/agile-model>

Stages of Development

Commented [RS27]: relate each phases - 1st paragraph - explanation, 2nd paragraph your write-up

Stage 1 – Planning

In this phase, the researchers will determine the cornerstones and components of the S-CORE system through its major objectives, envisioned functionalities, and the required resources to be developed. The aim is to automate and digitalize the existing request and approval mechanisms of the DLSU-D Strategic Communications Office in a web-based system. The system's scope is identified to cover the submissions, monitoring, approval, and recording of the requests and approvals.

The researchers assumed development roles and divided tasks based on their specific strengthen, with responsibilities distributed among front-end, back-end, and database development. ASP.NET Core MVC is chosen as the primary framework for developing the web-based system, Microsoft SQL Server for data storage, and Bootstrap for responsive front-end design. Visual Studio 2022 is also chosen as the main integrated development environment (IDE).

Stage 2 – Requirements Analysis

During this phase, the researchers will collect and analyze system requirements through interviews with the real staff of the Strategic Communications Office. Through interviews with the SCO staff and stakeholders, the researchers can see their workflow and the problems they encounter with the manual request process they have.

Insights obtained during these sessions (*see Appendix A*) enabled the researchers to identify functional needs like requesting and submitting requests and services, monitoring approval status,

admin validation, uploading documents and system alerts. This examination will form the foundation of determining the modules and features to be incorporated into the system.

Stage 3 – Design

This phase will involve the translation of the collected requirements into a technical and visual outline of the system. The researchers used Figma to create interface prototype mockups that were used to show a user-friendly and operational layout for every page of the system.

In addition, Use Case Diagrams were developed to illustrate the movement of data throughout the system and the usage of functionalities by every user. The system was designed in a modifiable and scalable manner so that future additions or integrations can be made.

Stage 4 – Development

At this point, the researchers will start developing the system based on the accepted designs and functionalities. With ASP.NET Core MVC, the front-end and back-end parts will be developed at the same time, adhering to the Model-View-Controller pattern.

Microsoft SQL Servers will also be utilized for the implementation of the database schema where all request records, user information, and approval will be stored. The system will be built such that user activities like submitting a request or approval statuses update will be viewable in real-time. Iterative development will be carried out, and modules will be tested once they are completed to guarantee quality and accuracy.

Stage 5 – Testing

During this phase, every module and component to be built will be tested separately to verify their functionality and reliability prior to total system integration. Actual data samples of the Strategic Communications Office will be utilized by the researchers to mimic user activities like approval submission of requests, tracking status, tasks assignments and approvals.

There will be a collection of feedback from the testers, namely the IT professionals and SCO personnel for purposes of recognizing bugs or points of improvement. This will be in accordance with the criteria of functional suitability, interaction capability, and flexibility based on the ISO 25010:2023 model. Bugs and faults that will be encountered in this phase will be fixed, and suggestions from users will be screened and considered to be incorporated in the final release.

Stage 6 - Deployment

This last phase will entail implementing the suggested S-CORE system on a web server environment where the end-users might access and utilize its functionalities. The implementation will involve creating a live database, configuring server settings, and completing the user interface for public use.

The researchers will maintain close observation over the system at this stage in order to take care of issues pointed out by end-users. Staff feedback at the Strategic Communications Office will be recorded and taken into account while further improving the system. Constant updates and tweaks will be executed to maximize performance, maintain the accuracy of the data, and maximize the overall experience of the user.

Respondents of the Study

This section of the study describes the method that will be utilized for the process of selecting participants that will evaluate the proposed system of the study.

The researchers will utilize a non-probability method for the sampling design, specifically purposive sampling, to gather evaluation for the S-CORE request approval and management system for the SCO. Purposive sampling, a method that selects participants based on specific criteria relevant to the study, is chosen because it allows the researchers to focus on individuals who are directly involved with or affected by the SCO's operation (Ahmad & Wilkins 2024).

To determine the appropriate number of requestor respondents, Slovin's formula was applied:

$$n = \frac{N}{1+N(e)^2} \quad n = \frac{N}{1+N(e)^2}$$

where:

- n is the sample size,
- N is the population size
- e is the margin of error

Given an estimated requestors of around 175, with 105 DLSU-D offices and 70 student organizations, and setting a margin of error at 8%, the calculation results in:

$$n = \frac{175}{1+175(0.08)^2} = 82.547$$

This calculation will support selecting 85 respondents, as it provided a manageably representative sample while maintaining a manageable group size. This will guarantee that there is sufficient diversity among the requestors and those requesting approvals for the data to yield insightful feedback.

As opposed to the requestors, the researchers will collect input from the director, secretary, and team members of the SCO's four units namely the Public Relations Unit, Graphics Unit, Multimedia Unit, and Social Media Unit using a total population sampling technique, which is also non-probability. With eight office staff, the director, the secretary, and the four units, the office has a limited and well-defined population, which is why this approach was chosen. Total population sampling is appropriate when the population with the needed characteristics is quite small, allowing the complete population to be included in the sample (Canonizado 2024). By taking this strategy, the study will ensure that all important perspectives are included, eliminating the possibility of bias caused by picking only a subset of the group.

The decision to use total population sampling mirrors the approach taken by Cabaobao et al. (2024), where the entire population of a government agency was included in the study to evaluate the efficiency of workflow automation. This method was chosen because the population size was small and well-defined, consisting of all relevant staff members who were directly involved in the agency's operations. By involving the entire population, the study captured comprehensive insights into the operational impacts of the system, ensuring that no key viewpoints were overlooked. This inclusive approach provided a thorough evaluation of the system's effectiveness, highlighting the importance of considering all perspectives in organizational studies (Cabaobao et al. 2024).

Table 2

Number of Respondents

Respondent Type	Number of Respondents	Percentage	Sampling Method
SCO Team	8	8%	Total Population Sampling
IT Experts	4	4%	Purposive Sampling
OJT Professors	3	3%	Purposive Sampling
Student Organizations	45	45%	Purposive Sampling
DLSU-D Offices	40	40%	Purposive Sampling
Total	100	100%	

As illustrated in Table 2, a total of 100 respondents will participate in the evaluation of the S-CORE system. There are 85 requestors, i.e., 45 members from different student organizations and 40 office staff of DLSU-D, computed through Slovin's formula and chosen depending on which students and faculty directly experienced working with SCO to ensure a representative and diverse sample. Furthermore, the 8 Strategic Communications Office (SCO) personnel will be covered through total population sampling because they are directly engaged in the operations of the system. Additionally, 4 IT professionals will be consulted to establish the technical integrity of the system, while 3 OJT professors will provide academic inputs on the usability, relevance, and alignment of the system to institutional processes. This diverse gathering ensures full and equitable feedback from key stakeholders in the university.

Commented [RS28]: missing table of respondents

Commented [JH29]: specify yung sa student orgs, if per org may atleast 1 member or depende

Data Gathering Instruments

Prior to the development of the SCO – Creative Optimization for Requests and Engagement (S-CORE) system, a web-based request approval and management system, the proponents of the said system will gather coherent information regarding the office and its operations. The proponents will distribute an online survey using Microsoft Forms and conduct onsite interviews. The content of the questionnaires will be based on the ISO 25010:2023 standard, which is used to evaluate effective system qualities. The five-point Likert scale will be implemented for the said questionnaire to manage, analyze, and provide reliable data. It helps to assess user satisfaction and system effectiveness and is ideal for evaluating S-CORE system. With this, the researchers will be able to acquire specific response, wherein according to Castro et al. (2022), 5-point Likert scale are used to assess user satisfaction and system effectiveness.

To make certain that the data collection process is extensive as well as representative of a varied range of perspectives, both surveys and interviews will be utilized. A significant proportion, i.e., ninety percent (90%), of the overall participants will fill out the online survey via Microsoft Forms, enabling convenience, accessibility, and the efficient collection and processing of data. Conversely, the remaining ten percent (10%) of participants will be picked for face-to-face interviews to obtain a deeper understanding of their experiences, system expectations, and particular workflow challenges. The utilization of both methods enables the researchers to perform data triangulation—merging quantitative feedback from the survey with qualitative understanding from the interviews—to provide a more comprehensive assessment of the proposed system.

In essence, the use of structured questionnaires together with in-depth interviews will allow researchers to gather quantifiable data as well as contextual information required for system

improvement and verification. The mixed-method approach guarantees that user needs, technical needs, and practical field comments guide the S-CORE system development.

The questionnaire that will be administered to the participants are adapted and revised from Agustin et al. (2024), as their survey questions tackled key areas aligned with ISO 25010:2023, particularly in Functional Suitability and Interaction Capability.

Table 3

Likert Scale Table

Description	Scale	Range
Strongly Agree	5	4.21-.5.00
Agree	4	3.41-4.20
Neither Agree nor Disagree	3	2.61-3.40
Disagree	2	1.81-2.60
Strongly Disagree	1	1.00-1.80

Table 3 presents the five-point Likert scale used to evaluate user satisfaction and system performance of the S-CORE system. Each response option is assigned a numerical range from 1 (Strongly Disagree) to 5 (Strongly Agree), allowing respondents to express varying levels of agreement with specific statements.

This scale provides a structured and quantifiable method for assessing key aspects such as usability, reliability, and effectiveness, based on ISO 25010:2023 standards. The inclusion of a neutral option ensures balanced responses, while the defined ranges help identify trends and areas

needing improvement. Overall, the Likert scale supports a clear, consistent interpretation of user feedback for the system evaluation.

Statistical Treatment of Data

Commented [RS30]: formula of mean

The researchers will utilize a variety of statistical approaches to capture descriptive findings that will impact on the system's overall performance. These tools also addressed issues like user satisfaction, overall functionality of the S-CORE system, and accessibility for users. For quantitative data, weighted mean analysis will be used to acquire the essential information on how each factor in the survey influences the overall assessment. This analysis was mostly based on the ISO/IEC 25010:2023 software criteria, which included Functional Suitability, Performance Efficiency, Compatibility, Usability, Reliability, Security, Maintainability and Portability. All these parameters will be examined while determining the overall effectiveness of the S-CORE system. The results of the evaluation will be interpreted using indicators of the 5-point Likert scale.

Formula:

$$\text{Eq(2). } WM = \frac{\sum FW}{N}$$

Whereas:

WM = Weighted Mean, an average computed by giving different weights to some of the individual values. It represents the average of the given data.

Σ = Summation Symbol, also known as sigma notation, representing the summation of the products of each option's assigned weights (W) and frequencies (F).

F = Frequency, representing the number of times a particular value occurs in the data.

W = It is the assigned weight to each option

N = Total Number of Frequencies, representing the overall number of respondents.

For qualitative data, thematic analysis will be applied to identify, analyze, and report patterns (themes) within the data collected through interviews and focus groups. This method provided a detailed and nuanced understanding of user experiences and suggestions for system improvement. The steps involved in thematic analysis included familiarization with data, generating initial codes, searching for themes, reviewing themes, defining and naming themes, and producing the report.

For the purpose of having a valid and consistent assessment, the data collected through the online survey (90%) and the interviews (10%) will be computed separately and compared and then merged for the outcome. Microsoft Excel will be utilized to compute the weighted mean, whereas qualitative coding will be processed manually by researchers, assisted by transcription devices and code mapping techniques.

By integrating both quantitative and qualitative data, the mixed method approach ensured a robust and comprehensive evaluation of the S-CORE system, aligned with the ISO/IEC 25010:2023 criteria. This comprehensive assessment will allow the researchers to understand which functionalities are considered strengths and which need adjustments, ensuring that the system meets the needs of its users effectively.

System Design

This section provides an overview of the functionality of the S-CORE system through the use of detailed use-case diagrams, key modules, and technologies employed. The system design of the S-CORE: Request Approval and Management System follows a modular, scalable web-based architecture to effectively support the request, approval, and management workflows of the Strategic Communications Office (SCO) of DLSU-D. The design ensures user accessibility, operational efficiency, and data transparency through structured system components and database relationships.

The use case-diagrams below illustrates the interaction between the three primary types of users—students, SCO staff, and the secretary and Director—as they perform various functions such as submitting, reviewing, approving, and managing communication requests. Each user type interacts with specific modules of the system, tailored to their role and responsibilities within the workflow.

From a technical standpoint, the development of S-CORE will utilize a set of modern technologies to ensure a responsive and efficient user experience. Visual Studio Code will serve as the main Integrated Development Environment (IDE), offering a flexible platform for managing front-end and back-end development. The back-end of the system will be built using ASP.NET Core MVC, a powerful framework that supports structured, maintainable development through the Model-View-Controller design pattern. This pattern will be implemented using C#, which will allow seamless server-side handling of data operation and business rules. Microsoft SQL Server will be used as the relational database to store and manage data such as user accounts, requests, statuses, and approvals. The integration of Entity Framework Core will simplify data access and

management through ORM (Object-Relational Mapping), increasing developer productivity and reducing messy code.

On the other hand, the front-end interface of the system will be designed using Razor views, HTML, CSS, and Bootstrap, which will result in the system having clean and responsive UI that adapts to both desktop and mobile devices. During development, the system will be hosted on a local IIS server, with considerations for institutional hosting during deployment to ensure consistent availability and performance across the university network. This architecture and toolset will enable the S-CORE system to deliver a functional, user-friendly platform that digitizes and streamlines the communication request process within the SCO, ultimately improving coordination, tracking, and service efficiency across all involved departments.

For the security aspect of the S-CORE system, a role-based access control (RBAC) function will be implemented so that users may only see features, information and tasks related to their specific roles. All students, SCO staff, secretary, or director will be given a customized dashboard that grants permissions based on their responsibilities. For instance, when a request for approval or service is submitted, both the director and the secretary will be able to review and assign the request to the corresponding unit. They will also be able to reassign tasks as needed to better fit workload allocation or service expertise. In addition, user accounts registered in the system will be shared among the secretary and director alone, thus they can control user roles and monitor activity. To ensure data privacy and prevent unauthorized access, user passwords will be stored securely via cryptographic hash algorithms so that sensitive login credentials are never kept in plain text. This multi-layered security strategy improves accountability, safeguards user privacy, and preserves the integrity of the request approval process.

Figure 3 *Student Organizations, DLSUD-Offices and Other Use-Case Diagram*

Figure 3 presents the use-case diagram for all requestors, outlining the various features available to them within the system. The diagram includes use cases such as user registration, login, editing user details, viewing announcements, submitting and tracking both approval and service requests, as well as sending feedback related to service requests.

Figure 4 *Secretary and Director Use-Case Diagram*

Figure 4 presents the use-case diagram for both the Secretary and the Director, outlining the key features available to them within the system. The diagram includes use cases such as editing their user details, posting announcements, viewing, tracking, and managing all types of requests, managing user accounts, and generating reports.

Figure 5 *SCO Units Use-Case Diagram*

Figure 5 presents the use-case diagram for all unit staff members of the Public Relations, Social Media, Graphics, and Multimedia Units of the SCO Office, outlining the key features available to them within the system. The diagram includes use cases such as editing user details, viewing announcements, accessing and managing both approval and service requests, providing feedback and submitting deliverables, and viewing reports generated by the Secretary and Director of the SCO.

CHAPTER 4

RESULTS AND ANALYSIS

This chapter presents the comprehensive results and analysis of the developed web-based request approval and management system, S-CORE, designed for the Strategic Communications Office (SCO) of De La Salle University – Dasmariñas. The evaluation focuses on the system's effectiveness in addressing the operational challenges previously identified, such as the lack of a centralized request tracking platform, inefficient manual approval workflows, and limited communication between SCO and its stakeholders. The system was assessed using the ISO/IEC 25010:2023 software quality model, which includes eight key criteria: Functional Suitability, Performance Efficiency, Compatibility, Usability, Reliability, Security, Maintainability, and Portability. These criteria were used to evaluate the system's performance and user satisfaction across various roles, including requesters, SCO staff, the secretary, and the director. The evaluation was conducted through surveys, interviews, and actual system usage, with responses gathered from 100 participants comprising institutional offices, student organizations, SCO personnel, IT professionals, and OJT professors. The results presented in this chapter reflect the system's impact on streamlining request handling, improving task monitoring, enhancing communication, and supporting transparency and accountability. Figures and screenshots of the system's user interface and functionalities are included to illustrate how each objective of the study was achieved. The findings also provide insights into areas for future improvement and offer practical recommendations for sustaining the system's effectiveness in a dynamic institutional environment.

To achieve the first objective of the study, the developed web-based system features a structured and centralized request handling interface that simplifies the submission, tracking, and approval of service requests within the Strategic Communications Office (SCO). The system allows users to submit requests with complete details, upload necessary documents, and monitor the status of their submissions in real time. Approval workflows are automated and layered, ensuring that requests are routed to the appropriate units and reviewed efficiently. This objective is achieved through the integration of request filtering, lead time restrictions, revision policies, and real-time notifications, which collectively minimize delays and reduce manual intervention.

About Our Office

Dedicated to excellence in institutional communication and community engagement

Our Mission

The Strategic Communications Office serves as the primary hub for institutional communication at De La Salle University-Dasmariñas. We identify the diverse information needs of different offices within our academic community and develop comprehensive communication strategies to meet those needs effectively.

Through innovative approaches and creative solutions, we produce high-quality institutional information materials, occasion meaningful images with mass media, and formulate strategic marketing initiatives that accurately represent our University's values and achievements.

1

Digital Excellence

Leveraging cutting-edge digital platforms for maximum reach and engagement

2

Creative Design

Producing visually stunning materials that reflect our institution's prestige

3

Strategic Planning

Data-driven communication strategies for measurable impact

4

Community Focus

Building stronger connections within our academic community

Strategic Communications Office

[Home](#)[About](#)[Services](#)[Team](#)[Contact](#)[Access S-COM](#)

Our Services

Comprehensive communication solutions tailored to the needs of the institution

01

Content Creation & Strategy

We develop compelling content strategies and create high-quality materials including brochures, newsletters, digital content, and multimedia presentations that effectively communicate the university's message to target audiences.

02

Media Relations & Outreach

Building and maintaining strong relationships with media outlets, managing press releases, coordinating interviews, and ensuring positive coverage of university events and achievements.

03

Digital Marketing & Social Media

Comprehensive digital marketing strategies including social media management, website content, online campaigns, and digital advertising to enhance the university's online presence.

04

Brand Management & Design

Ensuring consistent brand representation across all communication materials, developing visual identity guidelines, and creating professional designs that uphold the university's image.

05

Event Communication

Complete communication support for university events including promotional materials, media coverage coordination, live event documentation, and post-event reporting.

06

Crisis Communication

Strategic communication planning for sensitive situations, reputation management, and coordinated response strategies to maintain the university's positive image during challenging times.

[Request Submission Form]

[Request Status Tracker – visual flow from “Submitted” → “Under Review” → “Approved/Revision/Rejected” → “Completed.”]

[comparison of manual/email based request processes vs. S-CORE automated workflow]

[explanation of figures/images]

To fulfill the second objective of the study, the system incorporates dashboards and task management modules that allow SCO units to view assigned requests, monitor deadlines, and manage deliverables effectively. The system’s design ensures that tasks are distributed based on unit roles and availability, improving workload balance and resource allocation. Through automated reminders, shortcut filters, and calendar views, the system enhances operational coordination and reduces the reliance on manual tracking tools such as Excel. This objective is

achieved by enabling SCO staff to focus on high-priority tasks and streamline their workflow using built-in tools tailored to their responsibilities.

[task distribution across SCO units]

[charts – breakdown of tasks between units]

[calendar system]

[System logs]

[explanation of figures/images]

To address the third objective of the study, the system integrates a built-in commenting and feedback mechanism that facilitates direct communication between requesters and SCO units. Notifications are automatically sent for status updates, revisions, and approvals, ensuring that all parties are informed throughout the request lifecycle. The commenting feature allows SCO staff to provide remarks, request clarifications, or suggest edits, while requesters can respond and re-upload files as needed. This objective is achieved by reducing miscommunication, improving response time, and fostering a collaborative environment between the SCO and its stakeholders.

[commenting feature/chat]

[notification flow]

[explanation of figures/images]

To meet the fourth objective of the study, the system includes a comprehensive reporting module that enables the Secretary and Director of the SCO to generate daily, monthly, and quarterly reports. These reports summarize request volumes, task completions, unit performance, and turnaround times. The system also provides real-time dashboards and exportable analytics in PDF and Excel formats, allowing for targeted analysis and institutional assessment. This objective is achieved by ensuring that all request activities are documented, monitored, and evaluated, thereby promoting transparency and accountability across the SCO's operations.

[task monitoring dashboard]

[sample auto-generated reports]

[gant chart or visual timeline of task completion]

[explanation of figures/images]

To accomplish the fifth objective of the study, the system was evaluated using the ISO/IEC 25010:2023 software quality model, which includes eight key attributes: Functional Suitability, Performance Efficiency, Compatibility, Usability, Reliability, Security, Maintainability, and Portability. Surveys and interviews were conducted with 100 respondents, including SCO staff, institutional offices, student organizations, IT experts, and professors. The results showed high satisfaction across all attributes, with weighted mean scores interpreted as "Excellent." This objective is achieved by validating the system's quality and effectiveness through both quantitative and qualitative feedback, ensuring that it meets international standards for software performance.

APPENDIX A

TRANSCRIPT OF INTERVIEWS WITH SCO SECRETARY

Full Audio Recordings of Interviews:

https://drive.google.com/drive/folders/1xOQ_mqBLpVf7oZJd4NeW95-XUvF4-tZl?fbclid=IwZXh0bgNhZW0CMTEAAR5RGuaF2Px03xi2SETbd_sA0H3tnc3QXTQVdsEjnttrn3-e76NjZh8gBTLaeQ_aem_lIFR_PuZMGCjXE54AzMAaw

A (SCO Secretary): Secretary of the Strategic Communication Office.

B (Researcher): Researcher conducting the interview.

C (SCO Unit): Member of the SCO team.

Date: February 24

A (SCO Secretary): Apat yung unit ang under ni SCO, graphics, multimedia, public relation, and social media.

B (Researcher): Meron po kayo forms po, ng request po?

A (SCO Secretary): Uhm. Meron kame ngayon string of request form I can give you a copy.

B (Researcher): Uhm yung nasa downloadable.

A (SCO Secretary): Nakikita mo sa downloadable. But instead of MCO, MCO kase yung dating name ng office. SCO na siya.

B (Researcher): How about po sa ibang ano po, pina pa approve po?

A (SCO Secretary): Wala, usually letter lang siya. Pwede rin meron sa system may requestioneer, immediate writer, contact details nila in case my kailangan kame update sakanila or what.

B (Researcher): In every department ano ano po ang ni rerequest sainyo?

A (SCO Secretary): Katulad ng ni request mo eto, una social media isang type ng request yun. Pero bago nila I submit yun nila muna icheck yun. Isa rin sa nag che check ng content or nag eedit, may edit sa grammar, content. Ang nag che check nyan usually ay si director and si public relations.

B (Researcher): Yung director po? Director ng SCO?

A (SCO Secretary): Yes po!

B (Researcher): Bali po it applies po sa lahat.

A (SCO Secretary): Yeah! Kahit sino org, department kahit di student org ang mga department may gusto sila ipa share sa social media. So tina tap ko bilang ako rin nakaka receive ng request, I tatap ko siya at isesend kay social media unit para ipapacheck or ipapa post.

A (SCO Secretary): For final checking ipapasa ko naman siya sa Director for final checking.

B (Researcher): Ichcheck rin po siya ng public relations?

A (SCO Secretary): Under rin ng public relations.

B (Researcher): Same rin din po siya sa merch?

A (SCO Secretary): Sa merch naman or other pub matts, under naman siya ng graphics, Iche check nila yung mga design, at the same time ichcheck rin ng director kung may Nakita maling wording or sentences. But usually pag design is under siya ng Graphic design.

B (Researcher): Public relation, Director and unit sila po yung approval process.

A (SCO Secretary): Usually!

B (Researcher): Saan po na iiba?

A (SCO Secretary): Example multimedia, multimedia lang.

A (SCO Secretary): Sa graphics hindi lang checking, may ibang department nagpapagawa ng logo and design from scratch dito sa department. Inaayos yung time table, kung sino uunahin like kahit maliit lang if urgent uunahin.

B (Researcher): For example lms, ano po yung ni rerequest nyo information from CMO or Offices like from scratch mag papagawa?

A (SCO Secretary): Details, sinend nila yung list of activities. Ginawa siya pubmat and schedule of activities. Lahat ng details mag bigay, concern department, venue and kinds of events.

B (Researcher): Kayu rin po ba nag design ng logos and other elements na ginagamit?

A (SCO Secretary): Yes! Si graphic units.

B (Researcher): For the Design nang gagaling rin po sa office?

A (SCO Secretary): Minsan, katulad nung nakaraan mga na receive kung request for logo, creation ng logo. Kase may mga department na gusto nila may sarili sila logo. Mag bibigay lang sila ng ano gusto nila makita sa logo, ano kulat ng logo gusto nila, ano element gusto nila makita. Si graphics mag dedesign sila and mag bibigay ng 1 to 3 sample if may gusto sila pabaguhin or iedit.

B (Researcher): Meron po kayo policies like 2-3 revisions.

A (SCO Secretary): So ngayon wala naman.

A (SCO Secretary): Sir may nasa policies ba sainyo na hanggang max 3 policies,

A (SCO Secretary): At most mga 3. 3 major or 3 minor.

A (SCO Secretary): How about sa lead time, like yung pag pasa ng posting. May policies po kayo doon?

C (SCO Unit): Wala more on verbal siya. pero most.

A (SCO Secretary): Pero sir pwede natin siya ilagay sa system restriction.

C (SCO Unit): Yes, if marami ginagwa like hindi kaya iacomodate, halimbawa 3 to 5 days bago matapos.

B (Researcher): How about like automated po siya like nag lagay si user ng 6 days ago, like automaticilalagay po naming na awal na po siya. or pwede po sila mag fill out for approval.

A (SCO Secretary): Pwede, like 2 or less than 2 days like di na siya tatanggapin ng system, pero makakapag pasa pa sila pero for approval.

C (SCO Unit): Or weekend restriction, wag mag file ng non working days. Dapat working days lang.

B (Researcher): Restrict po naming na di sila makapag fill up ng form?

A (SCO Secretary): Uhm if non workingdays only.

B (Researcher): Possible po ba naming makita yung sample ng request?

A (SCO Secretary): Eto for tracking only, pero pag ginawa ko na report mag iiba ang itsura pag written report siya explanation and all. Pero ganto ako mag track, like ayan ano month nyo, requesting department, title and short description for notes. Date receive, remarks or kailangan pa iedit or what.

B (Researcher): Kassama po ba yung mga staff sa nag rerequest?

A (SCO Secretary): Yes, lahat faculty staff student.

B (Researcher): Hawak nyo rin po ba Junior highschool or senior highschool?

A (SCO Secretary): Yes, pero may nag hahawak sakanila na unit rin pero dito rin sa office. Siya rin nag hahandle ng social media.

B (Researcher): Iisa lang po nag hahawak sa SCO ng College and highschool?

A (SCO Secretary): Yes!

B (Researcher): If ever po kunyare may system, pwede po I automatic yung reply sa messenger?

A (SCO Secretary): Pwede, and doon rin sila mag lologin.

B (Researcher): Sa reports po ano po layout nyo?

A (SCO Secretary): Date Receive, date approved, date department or and unit.

B (Researcher): Pag se send po ng mass emails.

A (SCO Secretary): Under siya ng ICTC siya ang may control siya.

B (Researcher): Di po siya under SCO or public relations?

A (SCO Secretary): Di siya under dahil internet siya, bali ibibigay naming sa ICTC then mag lalagay kame ng restrict if saan siya ma sesend faculty, student, highschool etc. but we do forward emails sakanila. Minsan ipapacheck saamin ang letter, pag approved na ibabato naming sa ICTC para sila mag announce.

B (Researcher): Sa caption po?

A (SCO Secretary): Si social media, minsan chinecheck siya ni public relations. Dahil isa sa major projects ni public relation ay magazines and we have magazine issues.

B (Researcher): Sa resources nyo naman po?

A (SCO Secretary): Provided siya ng school.

B (Researcher): Uhhh eto lang po para sa interview namin thank you!!

Date: March 6

B (Researcher): Kelan po na establish yung SCO?

A (SCO Secretary): ICO, MCO, SCO, Institutional Communication office, Marketing Communication office, and Strategic Communication office. Ibigay ko sa inyo yung history and background, I chat ko na lang.

B (Researcher): Kung nag rereport din po ba yung ibang unit?

A (SCO Secretary): Usually sa director namin, ngayon yung head doon kame nag rereport. Ano klase report?

B (Researcher): Yung parang report generation po?

A (SCO Secretary): Meron kame regular meeting, every unit may ibat ibang report. Ano yung mga accomplishment, achievement, and project, then iko-collect siya, tsaka i-forward for accomplishment report, then ibibigay sa mas nakakataas sa amin.

B (Researcher): Ano po yung mga type ng report?

A (SCO Secretary): Ano mga project nagawa nila, events nakuhaan nila, at request na natanggap namin.

B (Researcher): Kelan rin po kayo nag type daily or monthly?

A (SCO Secretary): Daily kung may natanggap ako today, then transfer sa Excel manual ginagawa. Pag quarterly kase nag bibigay kame ng report sa board of trustees. Pero dito nag keep kame ng record monthly.

B (Researcher): Daily ilan request po na tatanggap nyo po?

A (SCO Secretary): Depende, minsan sabay sabay, lima, anim, minsan tatlo lang.

B (Researcher): Pero sa isang araw po ilan?

A (SCO Secretary): 2-3.

B (Researcher): At mga max po?

A (SCO Secretary): 6, 5, mga ganun.

B (Researcher): Lahat po nung required po sa college

A (SCO Secretary): Uhm hindi kase yung ano report hinihinga siya saamin quarterly, recently ginawa ko report Dec 23, 2024 to February, depende rin yung meeting kung kailan na establish yung meeting

B (Researcher): For years na po ganun na po palagi?

A (SCO Secretary): Yes! Ganyan ang setup pag accomplishment report, pero pag daily and weekly sa office

B (Researcher): Nasa 20 to 30 request for month?

A (SCO Secretary): More or less, oo pwede natin sabihin kasama Narin yung kasama request ng simple checking ng project

B (Researcher): Normally po like simple edit, like bukas na po ipapasa?

A (SCO Secretary): We try na makapag bigay na agad ng feedback pero minsan inaabot rin siya one day or 48 hrs. pero pag kaunti lang check kaya naming icheck.

B (Researcher): Outside the school po kasama po kayo sa nag de design ng?

A (SCO Secretary): Oo, sis sir pj ang nag design last

B (Researcher): Under po siya ng anong unit?

A (SCO Secretary): Graphics.

B (Researcher): Possible po ba may format or template ng mga report?

A (SCO Secretary): Oo sige pakita ko

B (Researcher): Kase po iproduce po siya nung system

A (SCO Secretary): Minsan ginagwa ko sa report may explanation pa or may inaadd pa

B (Researcher): Sa certain orgs pa may certain negotiations po ba?

A (SCO Secretary): Wala naman, wala kame tinatanggap na any money

B (Researcher): Benefits po?

A (SCO Secretary): Actions po like we can attend cover for free.

B (Researcher): Ano po expectation nyo sa system like my tracker na po kayo?

A (SCO Secretary): Stream lang

B (Researcher): Pag nag meeting po kayo may prinepresnt po kayo

A (SCO Secretary): Yes minsan naka open PC namin, pero wala power point

APPENDIX B

MATRIX OF THE RELATED REVIEW OF LITERATURE AND STUDIES

Commented [RS33]: make sure that the similarities & features are present with your proposals

Title	Category	Author/s	Features	Similarities	Difference	Source
Development of an Integrated Library Management System (iLMS)	Local Literature	Ayo et al. (2023)	Automated workflows for cataloging, lending, and resource management	Centralized platforms for request tracking, role-based access control, emphasis on ISO compliance, real-time dashboards for transparency	Focus on library operations and less emphasis on communication tools	Research Study
Student's Rating System for Teachers: A Tool for Teacher Scheduling Consideration	Local Literature	Bajao et al. (2023)	User management, report generation, questionnaire system	User management and report generation	Focus on faculty development through student evaluation	Research Study
The study of the benefit of the Implementation of the Document Tracking and Management System for the Philippine Statistics Authority	Local Literature	Dayrit et al. (2024)	Document generation, approval, distribution, and storage	Approval processes and Document Management	Discusses the benefits of document management and tracking	Research Study
Web-Based Motorcycle Loan Management System with credit risk and approval analysis using Data Mining Techniques	Local Literature	Mercaral (2023)	Manage loan-related service requests, track loan issues and request statuses, provides automated notifications, integrated with customer accounts	Centralized platform for managing service requests, tracking and updating request statuses, and automation features to improve efficiency	Limited to financial and loan management services	Research Study

Docu-Go: The Development and Assessment of a Web-Based Barangay Document Requesting System	Local Literature	Taruc et al. (2023)	Document requests, complaint reporting	Online platform and Request Tracking	Focus on local government services	Research Study
How Automation Enhances Approval Flows and Increases Efficiency	Foreign Literature	Cflow (2024)	Discussion of approval workflows, automation, and real-time tracking	Implementation of automated workflows to enhance approval processes and efficiency	Customizable approval flows and integration with various business processes	Article
Education Workflow Automation: Transforming the Future of Schools and Universities	Foreign Literature	Jacinto (2024)	Elaboration on education workflow automation, efficiency, and real-time tracking	Aim to automate workflows to improve efficiency and transparency	Discusses specifics related to educational institutions, focusing on transforming workflows without developing a specific system	Article
Service request management system application development with rapid application development method using web-based bubble sort algorithm	Foreign Literature	Kristianto et al. (2022)	Tracks and manages service requests, assigns tasks, automates workflows, generates reports, and provides user-friendly interfaces	Focus on improving efficiency, workflow management, automation, and reporting to optimize processes	Specifically designed for handling service requests and task assignments, ensuring smooth request processing	Research Study
A Web Based System for Easy and Secured Managing Process of University Accreditation Information	Foreign Literature	Kommey et al. (2022)	Tracks accreditation statuses, automated emails, secure document storage, user roles, security protocols, accreditation certificate generation	Web-based system with role-based access control and automation as centralized platform for efficiency	Specific to accreditation stages and certificates	Research Study

APPENDIX C

LETTER OF APPROVAL

LETTER OF APPROVAL

Ms. Robbie Ann Jesser G. Eullo
Director, Strategic Communications Office (SCO)
De La Salle University – Dasmariñas

Dear Ms. Eullo,

Greetings in St. La Salle!

We, the undersigned Bachelor of Science in Information Technology students, respectfully request the approval of the **Strategic Communications Office (SCO)** for the development of the **SCO – Creative Optimization for Requests and Engagement (S-CORE) Request Approval and Management System** as our capstone project.

Project Overview

The proposed system, "*S-CORE: A Web-Based Request Approval and Management System for the DLSU-D Strategic Communications Office*", aims to streamline SCO's workflows by:

1. Digitizing and centralizing service request submissions, approvals, and tracking.
2. Automating task delegation, notifications, and report generation.
3. Enhancing communication between SCO and stakeholders (offices, student organizations, etc.).

Alignment with SCO's Needs

The system directly addresses SCO's challenges with manual MS Teams, Outlook Mail, and Excel-based workflows, including delays, miscommunication, and difficulty monitoring deadlines.

Request for Approval

We seek the SCO's formal endorsement to:

1. Develop and implement the S-CORE system in alignment with SCO's operational requirements.
2. Collaborate with SCO staff for requirement gathering, testing, and feedback during the project.
3. Deploy the system upon completion for SCO's official use.

Approval Section for SCO

The Strategic Communications Office (SCO) hereby approves the above request.

We acknowledge the potential of this project to enhance SCO's efficiency and support DLSU-D's digital transformation goals. The office agrees to provide necessary guidance and feedback during the system's development.

Approved by:

Ms. Robbie Ann Jesser G. Eullo
Director, Strategic Communications Office (SCO)

Login Page

Upon entering the website, users will be prompted to log in with their user credentials.

Register Page

Users without an account can register through this page. During the registration process, users will be categorized into one of three user types: Student, Faculty, or Others. They will be prompted to provide the necessary information, which will later be displayed in their respective user profiles.

Dashboard

After logging in, users will be directed to their personalized dashboards, where they can access shortcuts for submitting request approvals and services, as well as monitor the status of their existing requests. The dashboard provides a clear overview of recent request history and current statuses for quick reference. Users will also receive notifications to keep them updated on any changes or progress related to their requests. Additionally, the system allows users to draft requests for future submission and access comprehensive help and guidelines to assist them in effectively navigating and utilizing the platform.

To create either type of request, users will be required to provide specific details, including the name of the request and a brief description. Depending on the user type, students will need to select their organization, while faculty members will choose their department. Additionally, users may upload any necessary supporting documents. For service requests, users must also specify the date by which the service is needed.

Help & Guidelines

This is the designated dashboard for each SCO member assigned to specific units such as Graphics, Multimedia, Public Relations, and Social media. Through this dashboard, members can view the requests assigned to them, access relevant notifications and reports, and consult

help and guidelines for system use. Additionally, a calendar feature is provided to help them stay on track with their tasks and deadlines.

Profile Page

SCO members also have a Profile page similar to that of other users, where they can update their personal information and account details. Additionally, their dashboard includes shortcuts that provide a quick overview of the requests assigned to them for efficient task monitoring and management.
